

## Fall Protection Safety Assessment

Ellis Fall Safety Solutions will conduct a fall protection assessment for your facilities to assist you and your management with evaluating work done at elevation at your site. This assessment will include a review of site fall protection practices, procedures and programs.

Our Fall Protection Consultant will review and evaluate tasks being performed at elevation as identified by plant supervision and safety personnel during the on-site fall protection assessment.

Plant supervision, safety personnel and employees who work at elevation are expected to actively participate during the assessment.

This assessment is consistent with OSHA Fall protection Standard 29CFR1926.500 and the new ANSI Z359-2007 Fall Protection Code.

A wrap-up meeting will be conducted with management prior to leaving the site to discuss all findings and review our recommendations.

Observations and recommendations will also be documented in a written report.

Engineering design if necessary to solve these undefined activities are not included in this service however we will provide a fixed price proposal to assist you in implementing the recommendations.

Our visit should be viewed as a learning experience and we hope you will plan to use this assessment service to expand your knowledge of fall protection.
